A NOTE ON MY EXPLANATIONS/ INSTRUCTIONS.

I WILL INDICATE MENU ITEMS BY SAYING TOP->NEXT->NEXT LEVEL OF THE MENU.

FOR INSTANCE, IN THE EXAMPLE BELOW, IF I WANTED YOU TO PICK PLAY/STOP; I'D SAY PICK "CODING->AUDIO/VISUAL->PLAY/STOP"

Memos have only come to TAMS in a complete way with the release of TA 3.5. In this issue of the zine I want to take some time and outline how to work with memos!

Previous versions of tams allowed comments to be added to passages, but there was no way to write extensive notes about texts and then reference specific places in the database.

In TA 3.5, that capability is added, along with others that really make TA more useful for memoing.

coreInterviewB.rtf

Memos are just documents in your database. Create them with the new button. You can code memos, and, if the memo is in your search list, the coded passages will be in your results. You could also leave them out of the search list, or make a separate search list with them.

Edit Search

```

There is also eden  
the small na unit  
boundaries b nd  
Protesters and edics; buddies an  
complex cosmology emerges.
```

I have multiple memos in a single file; each starts with the date, coded as "date."

Edit Search

```

{!last date}  
{date}2008-10-13 20:23:14 -  
{!setcode bou buddy}  
Thoughts on tio  
this analysis: or  
ce and the io  
is also r c  
all nat om  
ies between medics  
and medics; budd  
cosmology emerge
```

I structure the document around the date, by declaring it the "!last" context code in each memo block

I use the insert date from the Coding menu; but if you don't like the format, just hand type it in!

{!last date}

{date}2008-10-13 20:23:14 -0700

{!setcode boundary, buddy}

Thoughts on some distinctions

After the date, I use !setcode to tag this memo. Basically, this acts as the subject line of the memo.

These are not context codes. They are data codes. In a search, the entire memo will be returned one time for each setcode word I have here. These codes do not need to be declared. You can make up tags as you go.

While you can make up tags as you go along, you may want to use the codes you've created, for consistency's sake. To do so, just drag the code you want to add from your code list to your !setcode statement. You will have to add commas between the codes you drop in.

the meds

!setcode assumes that you are not using the coder initials and that you want the codes you list to end at the same time your !last statement ends (before the next item coded with date, in our example).

Alternatively you could use !setcodeinfo which lets you set the codes, the coder and the point at which the codes terminate. The syntax looks something like {!setcodeinfo codes="boundary, buddy" coder="MGW" horizon="end"} If this is confusing to you (especially the horizon bit) you'll need to look at the User guide to understand what a horizon is for a TAMS variable, and what end vs. endsection do. Both the coder and the horizon are optional.

If you choose to use tags not in your code list, you can add them later.

Add >

Add all >>

< Remove

Make sure the files using !setcode and !setcode info are in your search list.

Pick the "Project->Import codes from !setcode" menu option.

Name:

Color: Use

Definition:

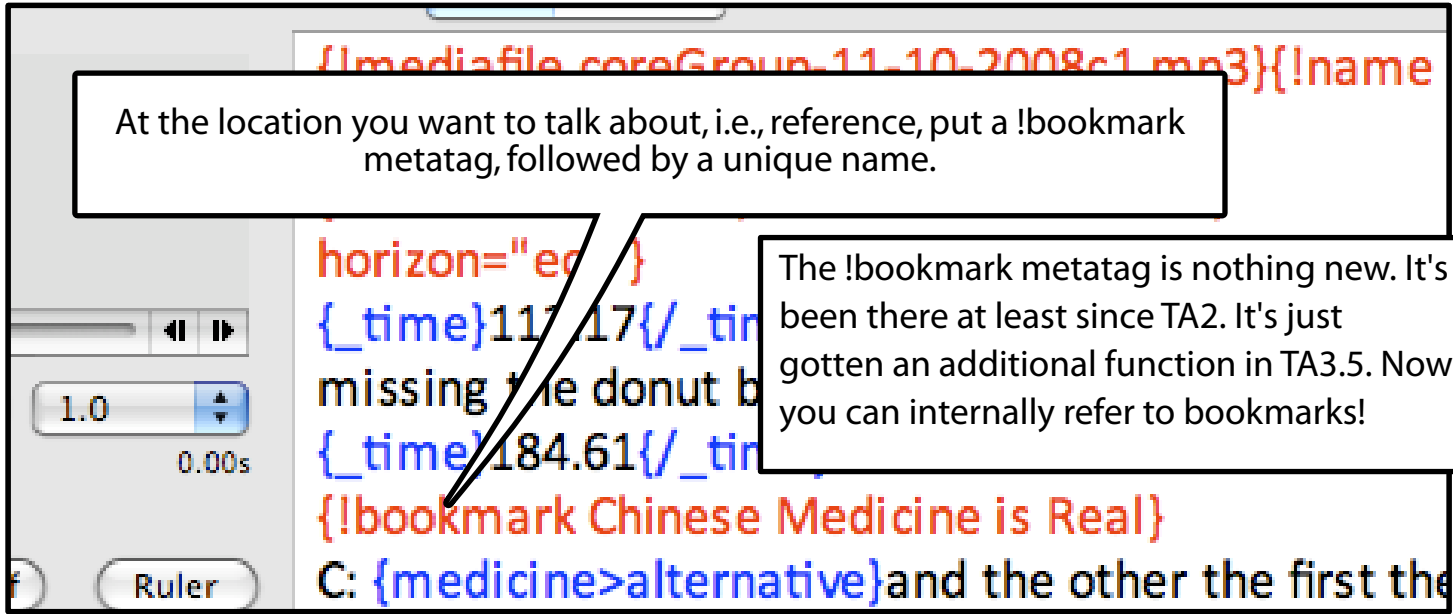

TAMS will check to see if any of the codes are new. If they are, TAMS will put together a hot code list of the new codes and open the "Define codes" tab so you can add definitions for just these newcomers. (new in TA 3.52)

So now you have a basic memo file. You could have one or many, each with `{!last date}` at the top; each with multiple memos using a specific date coded as "date" as the last context variable.

But to be really useful you'll want to link to other documents that you are talking about

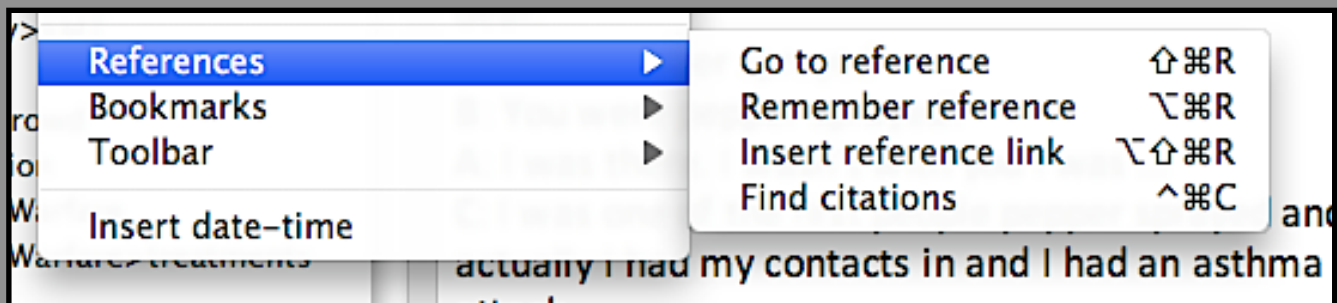

There are 2 steps to this. First you need to mark the place you want to jump to. Then you need to refer to that place!

At the location you want to talk about, i.e., reference, put a `!bookmark` metatag, followed by a unique name.

The `!bookmark` metatag is nothing new. It's been there at least since TA2. It's just gotten an additional function in TA3.5. Now you can internally refer to bookmarks!

Once you have your bookmark in place, click anywhere inside of it. Then pick from the Coding menu, "References->Remember reference"

That will copy it to the clipboard in the form of a reference.

Now, open your memo. Click where you would like the reference to appear.

...f medical value of chinese r
--Discussion of chinese medicine as making
real; also of first aid as lower status.
->{!goto file="coreGroup2008-11-10c1.rtf"
bookmark="Chinese Medicine is Real"}
->{!goto file="coreInterviewB.rtf" bookmark
medicine reference

Then pick "Insert reference link" from Coding->References submenu (see last panel). Voila! A "!goto" tag will be inserted.

To use this link, click in it and pick from the menu bar "Coding->References->Go To Reference." The file with the bookmark will open and the bookmark metatag will be selected.

of chinese medicine
e as making things

```
->{!goto file="coreGroup2008-11-10c1.rtf"  
bookmark="Chinese Medicine is Real"}  
->{!goto file="coreInterviewB.rtf" bookmark="Alt  
medicine reference from train1"}
```

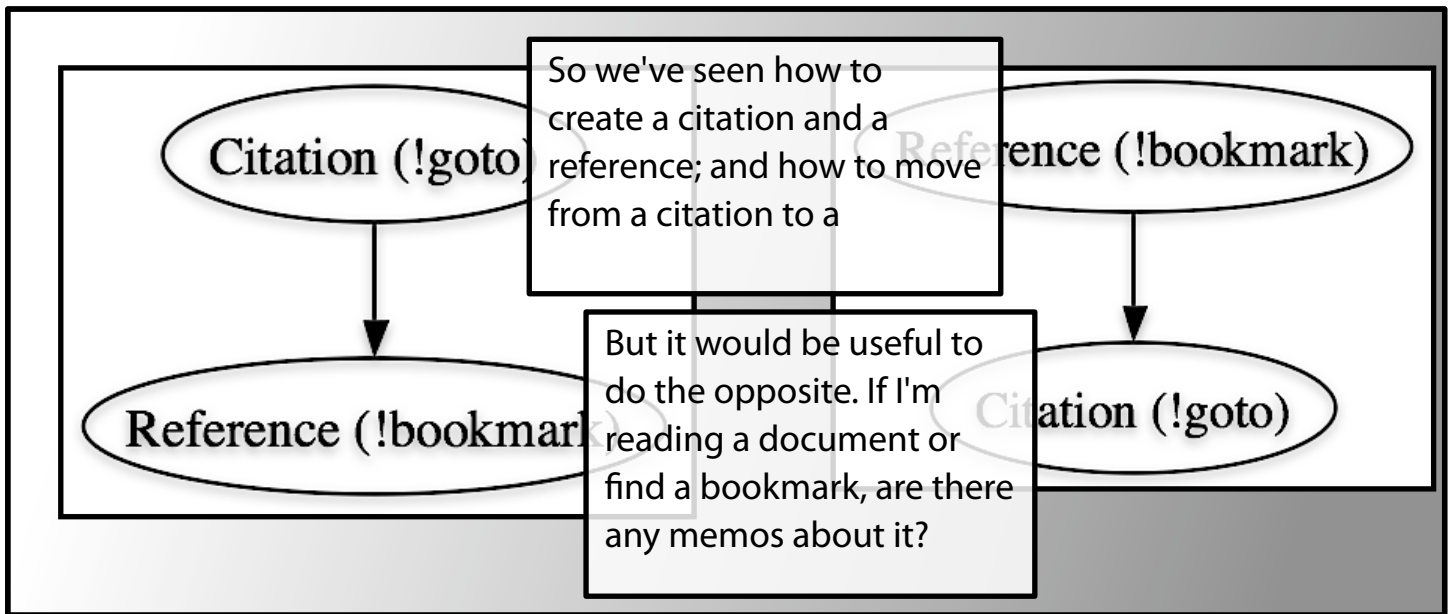

TA provides 3 very ugly icons to save you from having to dig through those menus. You can add these temporarily by using the customize toolbar option on the Windows menu BUT the buttons will not be permanent. They will be gone next time you open your window.

Instead, to make them permanent, use the !button command in your init file. The button commands for the three functions on the Coding->Reference menu are cmd::rememberReference, cmd::insertReferenceLink and cmd::goToReference

You will find all 3 on the Coding->Toolbar->Commands

```
{!button cmd::recolorTags,  
"<comment>","</comment>",l,  
cmd::delTagPair,l,cmd::rememberReferen  
ce,cmd::insertReferenceLink,cmd::goToR  
eference,l,cmd::findPrevTag}
```
